

NO-FEAR

Webinar – Innovative Solutions for Disinfection Methods - August 27th 14:00 CEST

As part of NO-FEAR's strategic focus on COVID response learning, Work Package 4 (*Acute care operations in security related incidents*) is conducting a webinar series on operational lessons identified from the COVID response. An important lesson observed is that "traditional" disinfection methods employing high concentrations of bleach – when used with high frequency – are harmful to equipment and vehicles. They are also not environmentally friendly. Health care organizations (intra-hospital as well as pre-hospital care) are looking to different global providers for innovative disinfection solutions. Some are already in use.

In response to this, NO-FEAR is hosting a 90 minute webinar on August 27th at 14:00 CEST, which is designed to be of interest to experts and specialists in operations, ICP (Infections Control and Prevention), and environmental factors, as well as other practitioners, researchers, and health officials. The agenda is as follows:

- Introductions – coordinator (UPO)
- Issue definition – MDA
- Suppliers presentations
- Q&A
- Conclusions – coordinator (UPO)

The webinar will provide each supplier with a 5-minute timeslot to present their innovative disinfection solution and the opportunity to post a more detailed description and contact information on the NO FEAR portal. If you are a supplier with an interesting solution, please contact Miss Natasha McCrone (natasha@rinicom.com) prior to August 21st to discuss your ideas further.

The webinar is open to the public and designed for ICP (Infections Control and Prevention) experts (intra hospital as well as pre- hospital care). Pre-registration is required and can be completed here: <https://us02web.zoom.us/meeting/register/tZctdumqqj8jHdAZnmpi6mDwx0HKrplofo7l>
